Abstract. The current study looked at how computers help students of different reading abilities. Studies have been conducted on the effect of computers on educational achievement and attitudinal levels. During this study, we have gone through the impact of Bloom's taxonomy over the conventional system and then focused on integrating CAI in higher education. This research is branching out to encompass the use of computers in the education system. The paper aims to outline and elaborate on the way computers aid every department of life, including education. Information is much more valuable when presented within the context of education or training. Teaching to reflect well is known as "advance" teaching. This research paper is concerned with the educational faculties, facilities, and the organizational structure of the educational process. This study aims to focus on CAI to improve the quality of higher education in India. We have also discussed the areas where we can implement this technology

Keywords. CAI, Classroom lecture, Higher Education, Learning Process

1. Introduction

A person who uses a computer to help present the instructional material and track student progress is called instructional assisted interaction (IA). In Computer-Assisted Instructional (CAI), techniques are used to give instructions and test performance on a computer. As one moves through the learning process, one can move through various computer technologies that support it[3]. A variety of self-paced learning self-directed learning techniques include standard input into CAI linear programs, introduced elementary schools to collaboration with International Business Machines, which occurred in the mid-1950s and early 1960s. This CAI is a treasure trove of information that everyone who needs college and/department information should have. CAI is relevant for preschool through to post-secondary[2].

It brings about an overall improvement in computer-based instruction because it allows educators to engage in CAI with their students using these packages. The use of computers refers to being a tool to enhance and promote education. The topics are covered through examples, exercises, simulations, and problems to test the student's comprehension[7]. Computer-assisted instruction had been in existence for 40 years before the personal computer arrived; there are various job training topics that CAI could open up for advancement and new abilities in incorporating technology available[20]. Initially, CAI was used to improve traditional teaching modalities; as time went on, however, educational pressure imposed on all levels impelled time-efficient, high-quality teaching modalities. Several research studies on microcomputer applications have looked at their impact on learning outcomes and student attitudes. Most researchers agree that CAI tends to create a more positive effect on student attitudes than instruction. At this point, CAI probably has a positive impact on students[4].

2. Need of CAI Education Organization

Because we value knowledge, we have adopted Bloom's Taxonomy. Since the Taxonomy of Knowledge & Learning Outcomes was published in the late 1960s, it has created digital tasks, evaluated apps, and determined their success. A group of cognitive psychologists, educational researchers, educational theory developers, and assessment specialists put out a report in 2001. They argued that a single intelligence is needed to excel in this industry[5]. Bloom's Taxonomy can be helpful to students as well as teachers. The Bloom Taxonomy can make class assignments, identify and structure lessons, and devise curricula. Educational organization research will often have to do all three things. Gather new data from primary or first-hand sources, use existing data in an untested way or new model, or fulfill an original goal[6].

On the whole, no one wants to know how things like education and colleges work, except students and employees who need to follow the rules of those who don't know about configuration and fees. The essential requirement is the amount of flow in the department of servers[19]. For colleges to properly utilize Creative Applications of Information is for instructional purposes, they must become aware of university functionality. Many researchers and reviewers found that computer-based learning alone did not show an appreciable effect on achievement. This paper focuses on implementation needs and their advantages over traditional systems[8].

3. Specified areas of CAI

Tutorial work is of information and practice of various application methods, including drill and practice and games. The discovery approach offers a massive amount of relevant information about a specific course or subject and challenges students to probe, compare, and speculate on that data[9]. It's cheaper and safer to use simulation software to calculate and predict events than to engage in real-life activities. The problem-solving approach boosts a child's specific problem-solving abilities when presented with new skills; students benefit from repetition. Still, for them to be mastered, repeated practice is essential [10]. CAI is associated with other benefits, including a greater sense of self-control, improved attendance, motivation, and higher

performance on tasks and teamwork. Conventional instruction combined with CAI increases academic achievement over the use of either of the two alone[11]. However, many people have not been able to find any evidence supporting the use of conventional teaching alone, or CAI, as a strategy for improving students' creative development. There is evidence that computer-based learning improves performance better than traditional approaches. Conventional approaches lead to more favorable attitudes to computers, instruction, student learning, and self-learning [1].

4. Advantages of CAI

Several advantages of integrating CAI over conventional education system are;

a) Allows learning new skills and refining existing ones.
b) The students are excited and interested in real-time feedback.
c) Audiovisual, text, images, or a combination can be used in the program[12].
d) Data mining (specifically machine learning) optimizes information presented systematically and comprehensively, making it accessible and entertaining.
e) It looks for ways to help our teachers and authors grow their capabilities[15].
f) Interactive illustrations let you extract more visuals from a book than text alone.
g) Feedback and progress reporting facilitated with the use of computer technologies. Thus, the learner has the opportunity to work on his or her weaknesses over time
h) Your computer will patiently and calmly allow for an incorrect response[13].
i) To avoid student embarrassment, you can alter the style of instruction and the pace of delivery according to each individual's physical abilities.
j) As a novel technique, the novel process helps with enrichment because it adds variety to the program[14].
k) Many CAI training programs offer only a handful of options regarding how the material is presented and what learning strategies are included. Other programs are called learner-controlled because they are flexible enough to respond to students' needs and interests [16].

5. How it works

Using computers in this context will help a school better understand its instructional process. The use of computers to carry out operations in which creative thought is combined with instructional design. Interactivity is incorporated into the use of software and hardware programs. This software is highly user-friendly; everything is generally applicable in this educational context. When you have started the search, it will provide details on entering and applying [17]. The CAI is intended to assist staff in compiling information about team and work. Besides, it helps keep track of where they work and the number of teachers. This software tells you where admission forms are and what makes them available, so it's excellent for procrastinators[18]. Paying fees is beneficial in itself, but also, it pays for additional benefits as well. Choose the best for you. You can pay your fees in various locations or pick the one that works for you. It's also beneficial to include the exact geographic location of the server [21].

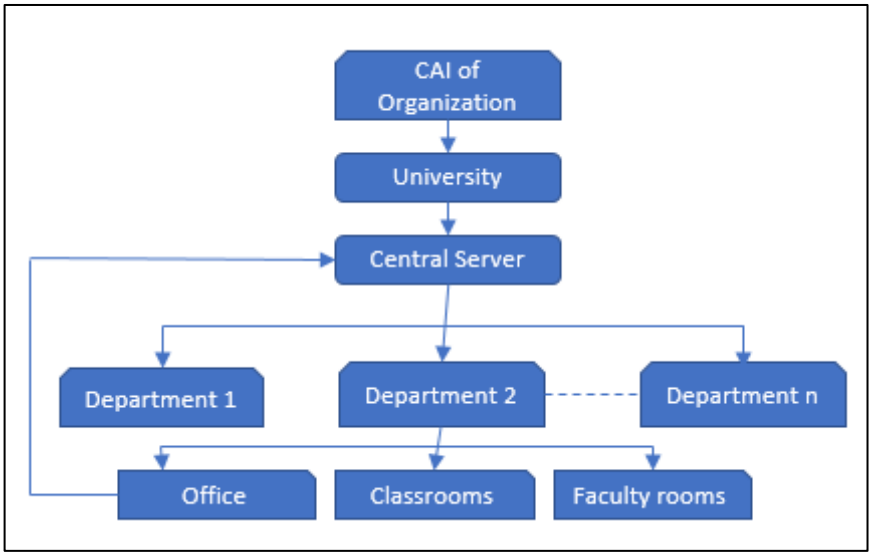

Figure 1. Implementation structure of CAI

Figure 1 shows the implementation structure of CAI by including various components. CAI of the organization is the root component. It transfers the data to the leaf components. University/Institute/College is another component of this system as it receives the information from the parent organization. Received information will be stored on the central server of the university/Institute/College, and it will be shared with all the sub-departments. Again departments will share their data to sub-sections related to the department. The advantage of this hierarchy is, the same data will be shared with all the stakeholders. In case of modification of data, revised data will be shared with them. This technique is used to minimize the resources with its maximum utilization.

6. Recommendations

a) CAI could be effective as a teaching strategy.
b) Initially, we can only use CAI on a few subjects, and even so, the implementation of CAI can be carried out regardless of the resources'
c) Language and culture differences between teacher and student can be lessened by using class-based assignments and assessments.
d) it may be used as an extension of classroom instruction for particular students
e) Cognitive ability can be enhanced through CI.

7. Conclusion

Researchers in several fields have tried to determine whether this hypothesis is true and have reached different conclusions. A majority of studies indicate CAI is beneficial to younger students. Research shows that CAI can benefit students of all three grade levels. The effect is less significant from elementary to secondary school to post-

secondary levels. The findings show that, for suitable careers, colleges need to devote a broad focus on educating students. While helping them find opportunities and provide guidance and assistance with career advancement, there needs to be regular and coordinated staff and programs specific to each field of study. It has collected accurate, intelligent data that demonstrated students' understanding and performance. Computer-Assisted instruction has become an effective and efficient means of delivering information. Worldwide research conducted on the Use of the CAI indicates that it is successful in most operating systems and computer platforms. If an educational organization is supposed to be involved in the educational process, it can be very time-consuming. However, it is available to everyone. It is well understood, as well, because of how straightforward it is. Using this CAI, you can get students to follow the rules.
